Deploy a Jenkins CI/CD Pipeline with Persistent Storage: Red Hat OpenShift with NetApp

This section provides the steps to deploy a continuous integration/continuous delivery or deployment (CI/CD) pipeline with Jenkins to validate solution operation.

Create the resources required for Jenkins deployment

To create the resources required for deploying the Jenkins application, complete the following steps:

1. Create a new project named Jenkins.

Create Project

Name *

Display Name

Description

Cancel

Create

2. In this example, we deployed Jenkins with persistent storage. To support the Jenkins build, create the PVC. Navigate to Storage > Persistent Volume Claims and click Create Persistent Volume Claim. Select the storage class that was created, make sure that the Persistent Volume Claim Name is jenkins, select the appropriate size and access mode, and then click Create.

Create Persistent Volume Claim

[Edit YAML](#)

Storage Class

 basic ▼

Storage class for the new claim.

Persistent Volume Claim Name *

jenkins

A unique name for the storage claim within the project.

Access Mode *

☒ Single User (RWO) ☐ Shared Access (RWX) ☐ Read Only (ROX)

Permissions to the mounted drive.

Size *

100 GiB ▼

Desired storage capacity.

☐ Use label selectors to request storage

Use label selectors to define how storage is created.

[Create](#) [Cancel](#)

Deploy Jenkins with Persistent Storage

To deploy Jenkins with persistent storage, complete the following steps:

1. In the upper left corner, change the role from Administrator to Developer. Click +Add and select From Catalog. In the Filter by Keyword bar, search for jenkins. Select Jenkins Service with Persistent Storage.

Developer Catalog

Add shared apps, services, or source-to-image builders to your project from the Developer Catalog. Cluster admins can install additional apps which will show up here automatically.

Created At	Documentation
 May 26, 3:58 am	https://docs.okd.io/latest/using_images/other_images/jenkins.html

3. By default, the details for the Jenkins application are populated. Based on your requirements, modify the parameters and click Create. This process creates all the required resources for supporting Jenkins on

OpenShift.

Instantiate Template

Namespace *

PR jenkins

Jenkins Service Name

jenkins

The name of the OpenShift Service exposed for the Jenkins container.

Jenkins JNLP Service Name

jenkins-jnlp

The name of the service used for master/slave communication.

Enable OAuth in Jenkins

true

Whether to enable OAuth OpenShift integration. If false, the static account 'admin' will be initialized with the password 'password'.

Memory Limit

1Gi

Maximum amount of memory the container can use.

Volume Capacity *

50Gi

Volume space available for data, e.g. 512Mi, 2Gi.

Jenkins ImageStream Namespace

openshift

The OpenShift Namespace where the Jenkins ImageStream resides.

Disable memory intensive administrative monitors

false

Whether to perform memory intensive, possibly slow, synchronization with the Jenkins Update Center on start. If true, the Jenkins core update monitor and site warnings monitor are disabled.

Jenkins ImageStreamTag

jenkins:2

Name of the ImageStreamTag to be used for the Jenkins image.

Fatal Error Log File

false

When a fatal error occurs, an error log is created with information and the state obtained at the time of the fatal error.

Allows use of Jenkins Update Center repository with invalid SSL certificate

false

Whether to allow use of a Jenkins Update Center that uses invalid certificate (self-signed, unknown CA). If any value other than 'false', certificate check is bypassed. By default, certificate check is enforced.

Jenkins service, with persistent storage.

NOTE: You must have persistent volumes available in your cluster to use this template.

- The following resources will be created:
- DeploymentConfig
 - PersistentVolumeClaim
 - RoleBinding
 - Route
 - Service
 - ServiceAccount

4. The Jenkins pods take approximately 10 to 12 minutes to enter the Ready state.

Pods

[Create Pod](#)

1 Running

0 Pending

0 Terminating

0 CrashLoopBackOff

1 Completed

0 Failed

0 Unknown

1 of 2 Items

Name ↑	Namespace ↓	Status ↓	Ready ↓	Owner ↓	Memory ↓	CPU ↓	
 jenkins-l-c77n9	 jenkins	 Running	1/1	 jenkins-1	-	0.004 cores	⋮

5. After the pods are instantiated, navigate to Networking > Routes. To open the Jenkins webpage, click the URL provided for the jenkins route.

Routes

[Create Route](#)

1 Accepted	0 Rejected	0 Pending	Select all filters	1 Item
------------	------------	-----------	------------------------------------	--------

Name ↓	Namespace ↓	Status	Location ↓	Service ↓	
 jenkins	 jenkins	 Accepted	https://jenkins-jenkins.apps.rhv-ocp-cluster.cie.netapp.com	 jenkins	⋮

6. Because OpenShift OAuth was used while creating the Jenkins app, click Log in with OpenShift.

7. Authorize the Jenkins service account to access the OpenShift users.

Authorize Access

Service account `jenkins` in project `jenkins` is requesting permission to access your account (`kube:admin`)

Requested permissions

- ☒ **user:info**
Read-only access to your user information (including username, identities, and group membership)
- ☒ **user:check-access**
Read-only access to view your privileges (for example, "can I create builds?")

You will be redirected to <https://jenkins-jenkins.apps.rhv-ocp-cluster.cie.netapp.com/securityRealm/finishLogin>

8. The Jenkins welcome page is displayed. Because we are using a Maven build, complete the Maven installation first. Navigate to Manage Jenkins > Global Tool Configuration, and then, in the Maven subhead, click Add Maven. Enter the name of your choice and make sure that the Install Automatically option is selected. Click Save.

A screenshot of the Jenkins "Maven" configuration page under "Global Tool Configuration". The page title is "Maven". Below the title, there is a section "Maven installations". At the top of this section is an "Add Maven" button. Below it, there is a table with one entry. The entry has a "Name" field with the value "M3". To the right of the "Name" field is a checkbox labeled "Install automatically" which is checked. Below the table, there is a section "Install from Apache" with a "Version" dropdown menu set to "3.6.3". At the bottom of the page, there are two buttons: "Add Installer" and "Add Maven". On the right side of the page, there are two red buttons: "Delete Installer" and "Delete Maven". At the very bottom, there is a link "List of Maven installations on this system".

9. You can now create a pipeline to demonstrate the CI/CD workflow. On the home page, click Create New Jobs or New Item from the left-hand menu.

10. On the Create Item page, enter the name of your choice, select Pipeline, and click Ok.

11. Select the Pipeline tab. From the Try Sample Pipeline drop-down menu, select Github + Maven. The code is automatically populated. Click Save.
